Membrane preparation

Membrane preparation

➤ Fabrication techniques (supported membranes)

Dry techniques {
PVD (Plasma vapor deposition)
CVD (Chemical vapor deposition)

Wet techniques {
ELP (Electroless plating)
EP (Electroplating)

Membrane preparation

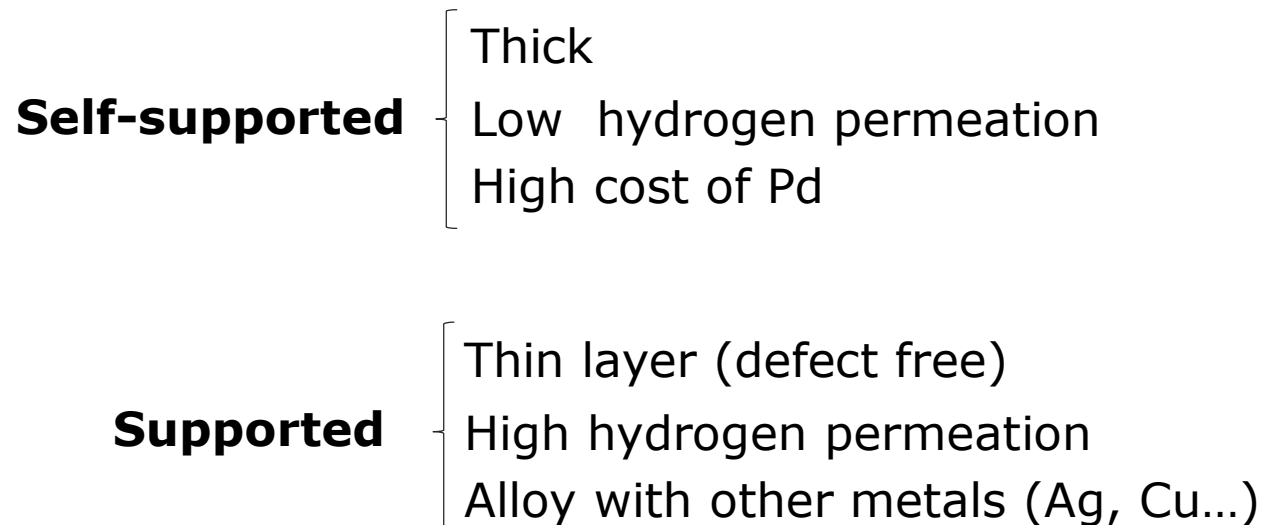

➤ Fabrication techniques (supported membranes)

Technique	Pros	Cons
PVD	<ul style="list-style-type: none">• Used for many metals• High deposition rate• Control of thickness and composition of alloys• No liquid wastes	<ul style="list-style-type: none">• Expensive equipment• Influence of support geometry (shadowing)
CVD	<ul style="list-style-type: none">• Complex geometries	<ul style="list-style-type: none">• Low deposition rate• Toxic reactants• Small-scale (complex to scale-up)
Electroless plating	<ul style="list-style-type: none">• High deposition rate• Complex geometries• Cheap equipment• Simple operation• Ease of scale up	<ul style="list-style-type: none">• For limited number of metals• Limited number of elements in the alloy (ternary alloy difficult)
Electroplating	<ul style="list-style-type: none">• High deposition rate	<ul style="list-style-type: none">• Support must be conductive• Need of electricity• Mainly used for pure metal (not alloys)

Membrane preparation

➤ Importance of the support

$$H_2 \text{ flux} = J_{H_2} = \frac{P_e^0}{\delta} e^{-\frac{E_a}{RT}} (P_{ret}^n - P_{perm}^n)$$

P_e^0 : Pre-exponential factor of H_2 permeability
($\text{mol m}^{-1} \text{s}^{-1} \text{Pa}^{-n}$)
 δ : Membrane thickness (m)
 n : n-value f(limiting step)

H_2 flux inversely proportional
to the thickness

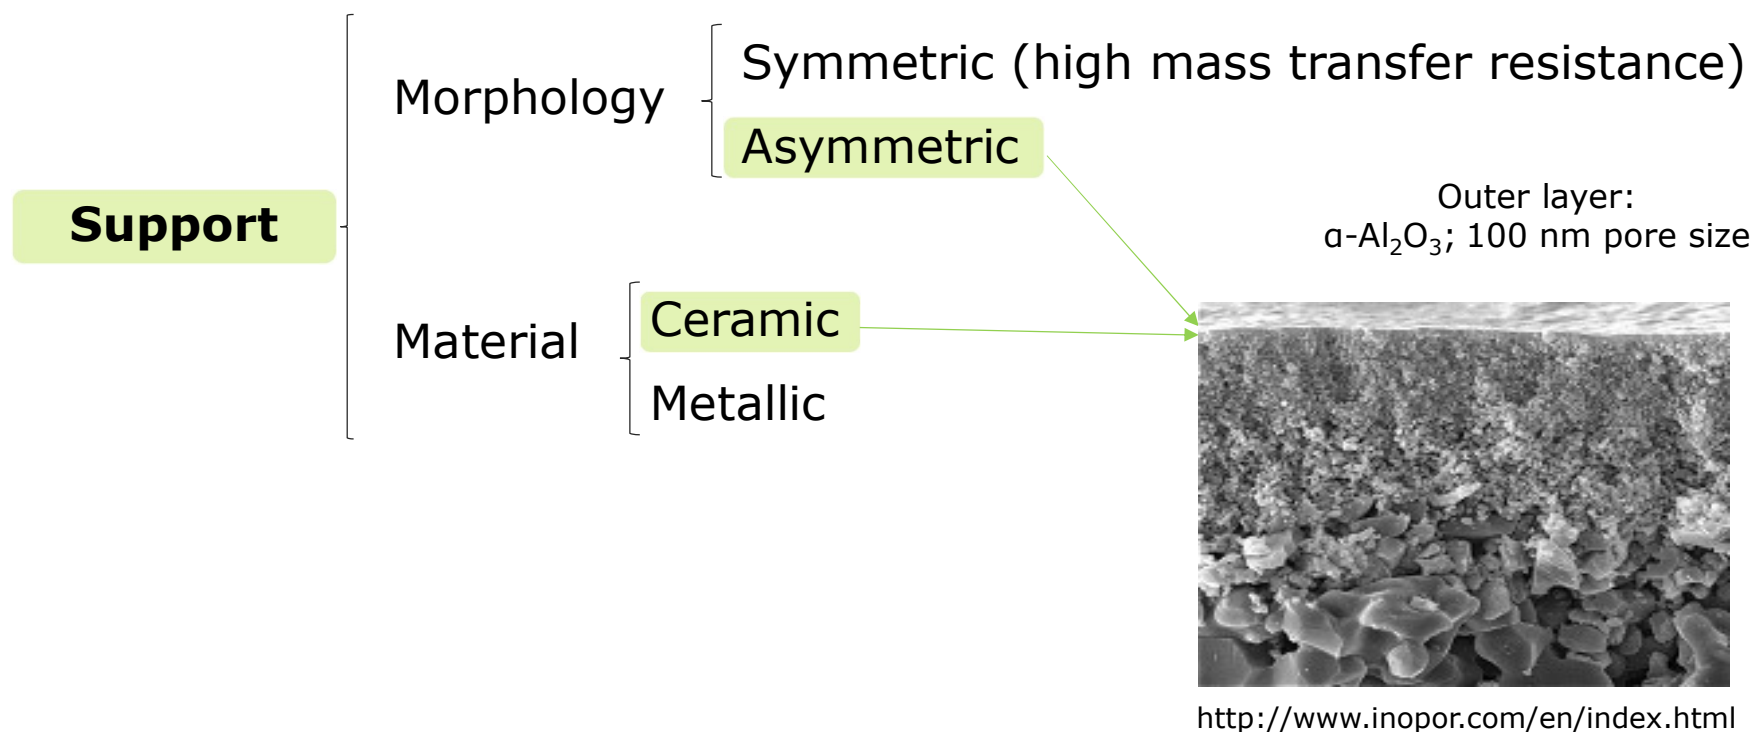

↑ H_2 flux & ↑ H_2 selective

Defect free thin membrane
(supported)

Membrane preparation

➤ Importance of the support

Membrane preparation

- ✓ Low mass transfer resistance
- ✓ Small pore size
- ✓ Smooth surface
- ✓ Easy to integrate into a reactor

Asymmetric ceramic support

Asymmetric metallic support

- ✓ No chemical interaction with Pd-based layer

Ceramic support: α -Al₂O₃, ZrO₂...
Metallic support: interdiffusion barrier

Membrane preparation

➤ Importance of the support

Support material (asymmetric)		
	Ceramic	Metallic
Pros	<ul style="list-style-type: none">• Low resistance to gas permeation• Small por size• Smooth surface• Less expensive than metallic supports	<ul style="list-style-type: none">• Low resistance to gas permeation• Mechanically strong• No problem with sealing• Easy to connect to a reactor

14

Membrane preparation

- Deposition of thin Pd-based supported membranes ($< 5 \mu\text{m}$)
(for high H_2 permeation and selectivity)

Membrane preparation

- Deposition of thin Pd-based supported membranes ($< 5 \mu\text{m}$)
(for high H_2 permeation and selectivity)

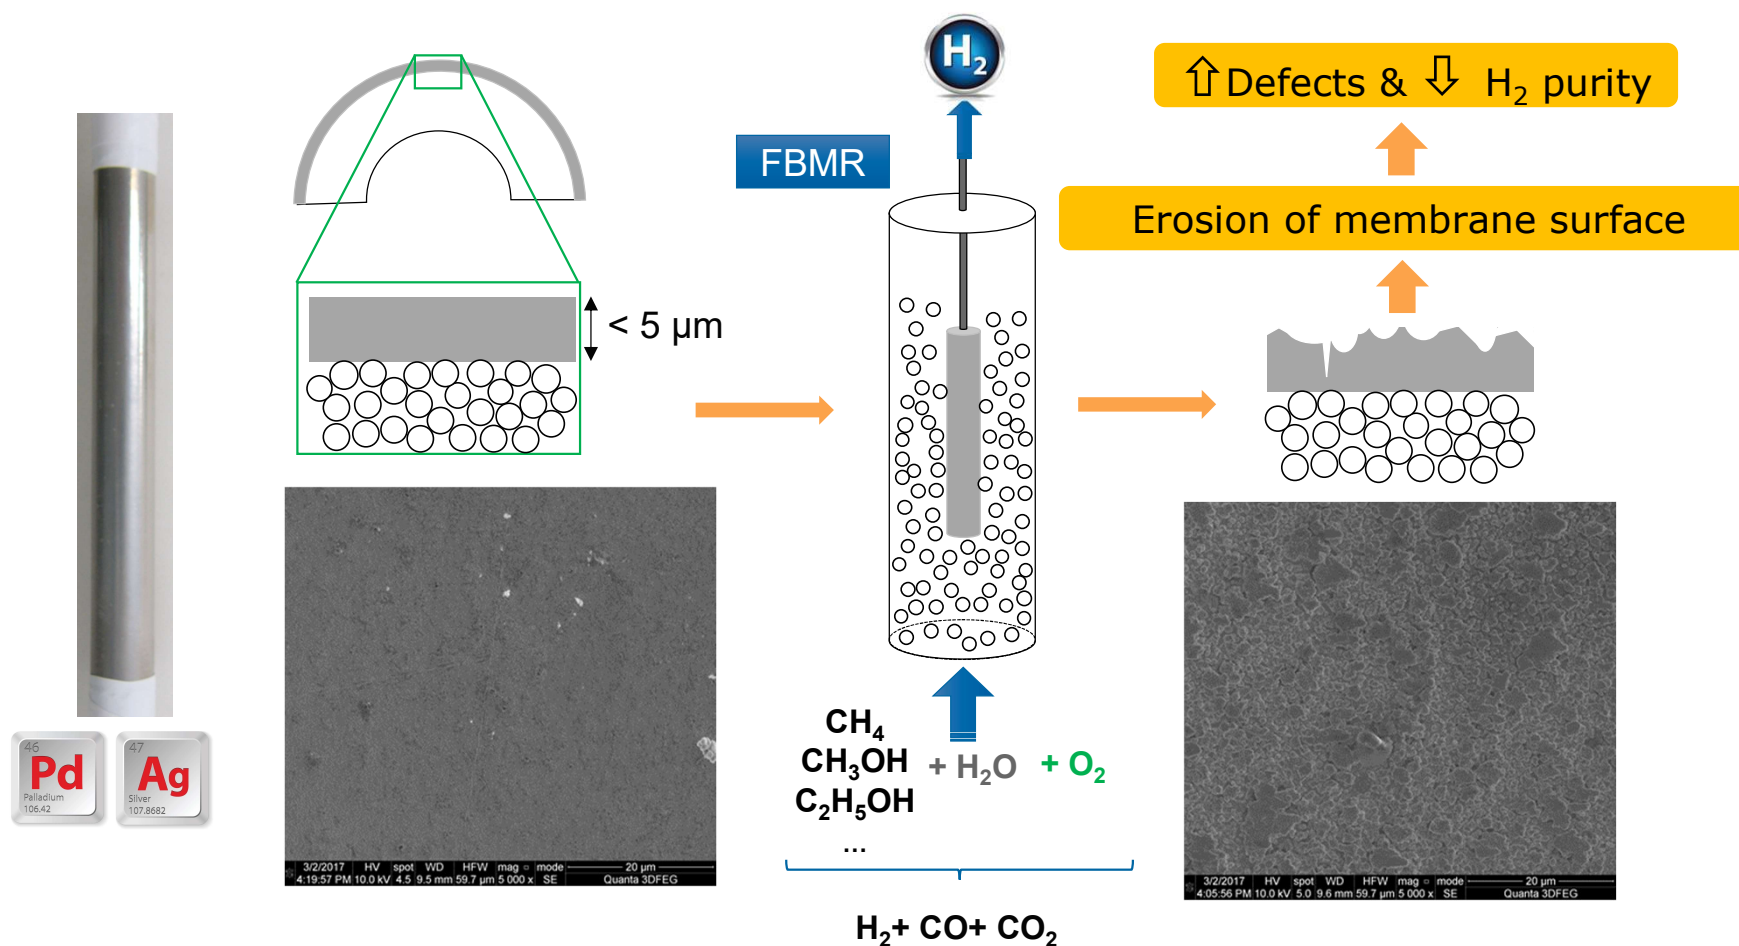

Ceramic supported thin Pd-based membranes
(with Swagelok-graphite connectors)

Metallic supported thin Pd-based membranes
(welded to dense metal tubes)

Membrane preparation

Membrane preparation

- Deposition of thin Pd-based double-skinned (DS) membranes (for high H₂ permeation, selectivity and attrition-resistant)

SEM image in cross section

European Union

Properties

Properties

- Diffusion mechanism: Solution-diffusion

Adsorption

Splitting

Recombination

Desorption

**Porous
support**

$$H_2 \text{ flux} = J_{H_2} = \frac{P_e^0}{\delta} e^{-\frac{E_a}{RT}} (P_{ret}^n - P_{perm}^n)$$

P_e^0 : Pre-exponential factor of H_2 permeability
($\text{mol m}^{-1} \text{s}^{-1} \text{Pa}^{-n}$)

δ : Membrane thickness (m)

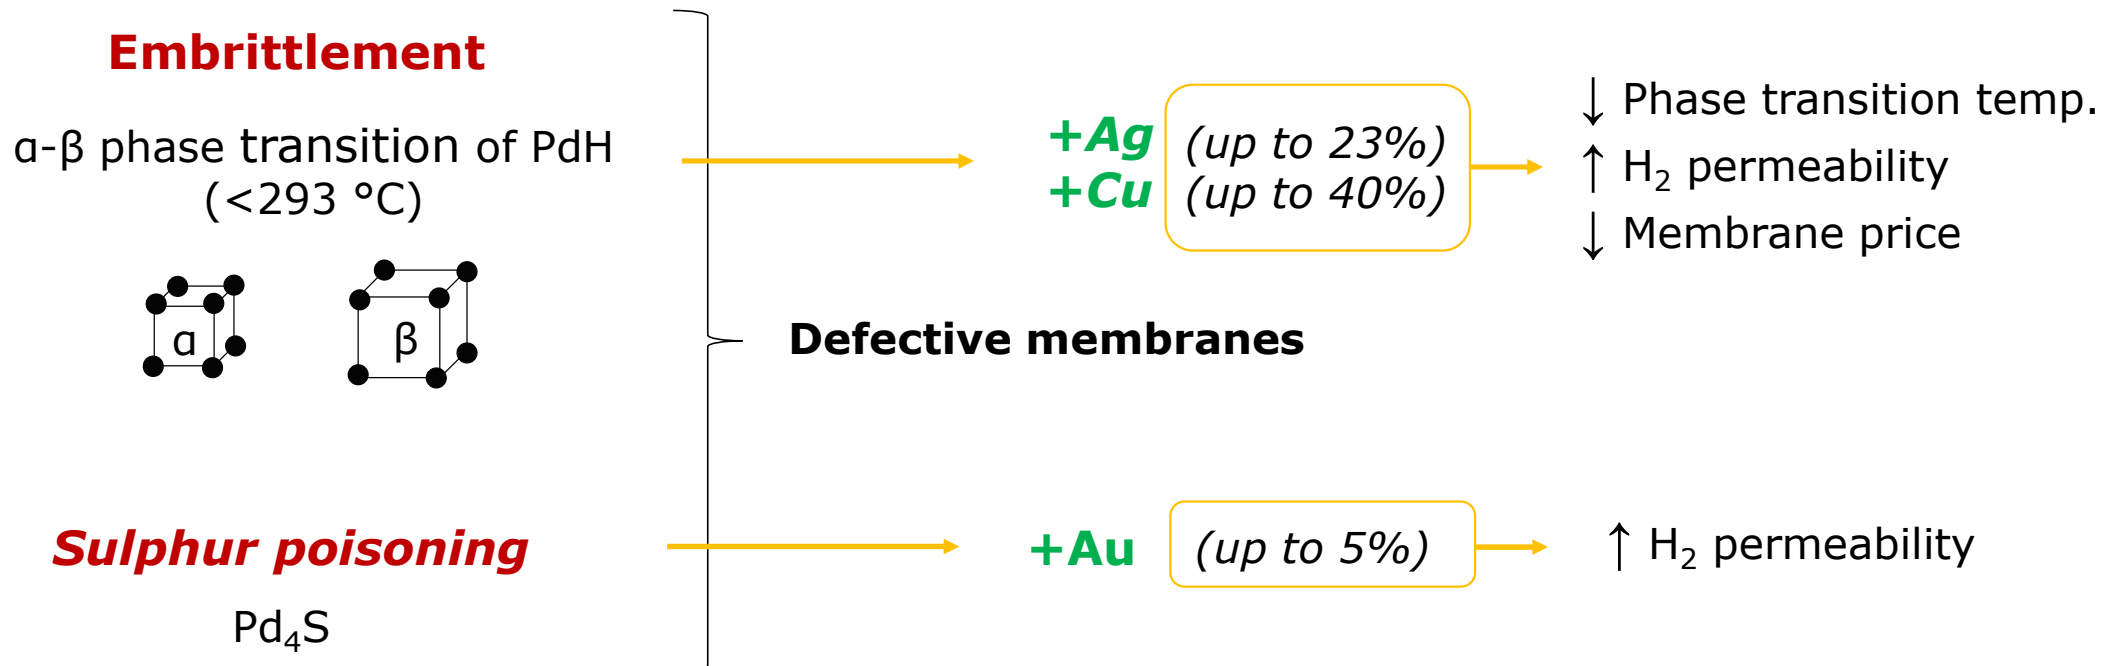

n : n-value f(limiting step)

$n = 0.5$ (Bulk)

$n = 1$ (Surface)

Properties

➤ Problems associated with Pd membranes

Properties

➤ Problems associated with Pd membranes

CO poisoning (syngas)

H₂ permeation inhibition

Carbon deposition (propane dehydrogenation)

Properties

- Problems associated with Pd membranes

Concentration polarization (thin layers)

Membrane performance

- Ultra-thin $\leq 1 \mu\text{m}$ thick (ceramic support)
- Thin 4-5 μm thick (metallic support)
- Stability test in an empty reactor (metallic support)
- Stability test in FBMR (metallic support)
- Chemical interaction with catalyst

Membrane performance

- Ultra-thin ($\leq 1 \mu\text{m}$ thick) Pd-Ag membranes (ceramic support)

1.3 μm thick Pd-Ag membrane

J. Melendez et al., J. Membr. Sci 528 (2017) 12-23

Membrane performance

- Thin (4-5 μm thick) Pd-Ag membranes (metallic support)

Ceramic support

Leak
zone

No Leak

No Leak

Metallic support

Long term permeation test at 400 °C

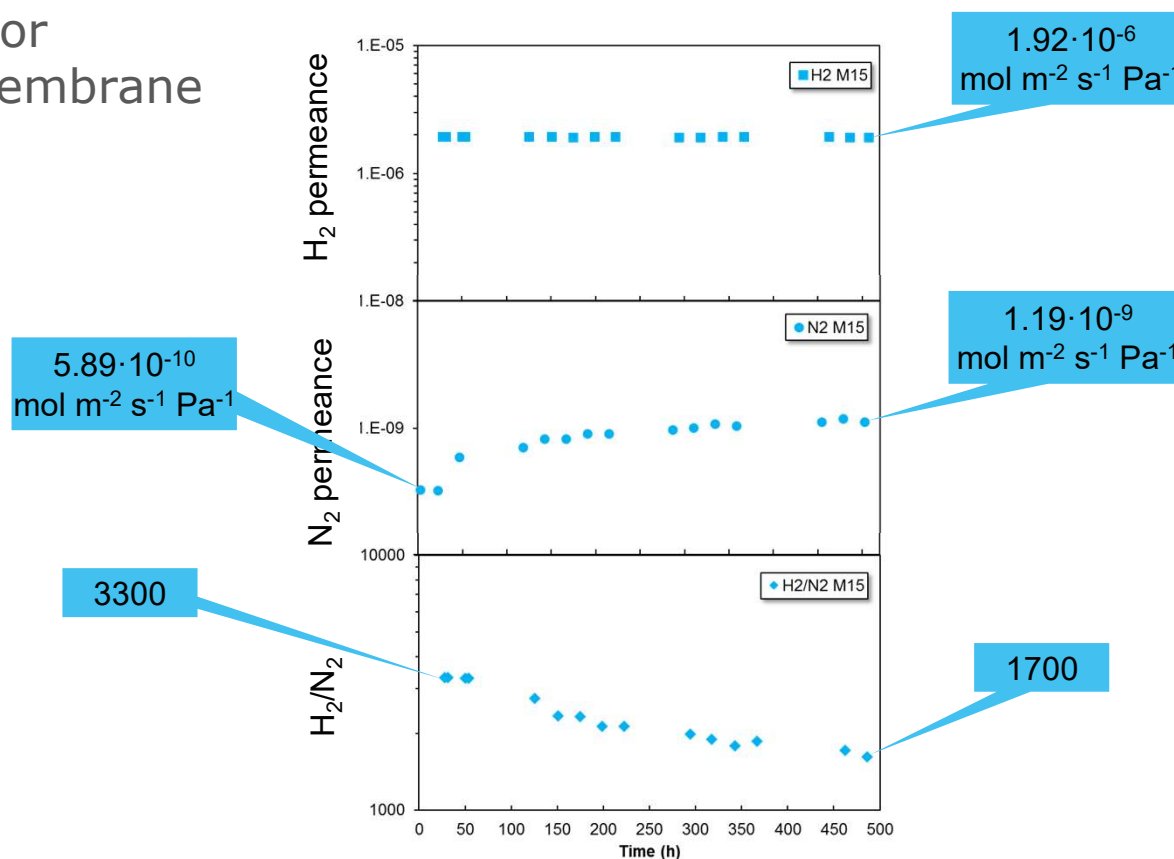

Membrane performance

- Stability test in an empty reactor
Metallic supported Pd-based membrane

500 °C, $\Delta P = 1$ bar (~ 510 h)

A. Arratibel et.al. J. Membr. Sci. 563 (2018) 419

Membrane performance

- Stability test in an empty reactor
Metallic supported Pd-based membrane

Parameter	M15	M15-DS	M33
H ₂ permeance* (mol m ⁻² s ⁻¹ Pa ⁻¹)	1.92·10 ⁻⁶	1.55·10 ⁻⁶	1.34·10 ⁻⁶
Ideal H ₂ /N ₂ permselectivity	3300	3500000	93300

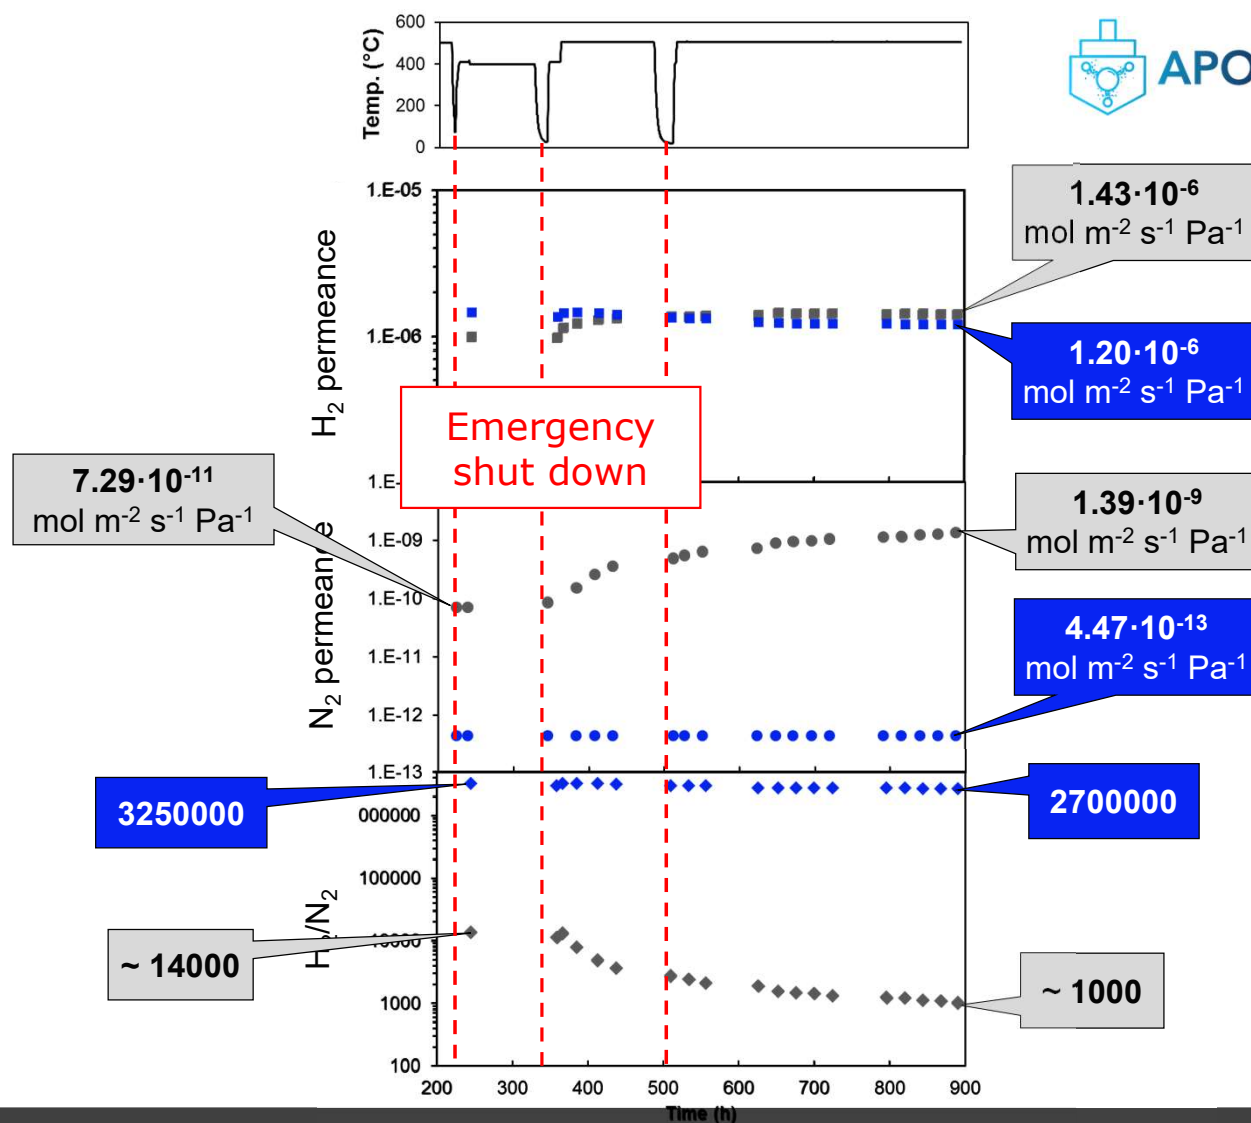

Funded by the
European Union

- Stability test in FBMR
(400-500 °C, $\Delta P = 4$ bar ~ 615 h)

A. Arratibel et.al. J. Membr. Sci. 563 (2018)419

Membrane performance

➤ Chemical interaction with catalyst

A. Arratibel et.al. IJHE 46 (2021) 20240-20244
